

AEGIS AI — Security Audit Report

Prepared for: Acme Corp | Date: August 30, 2026 | File: sample_ddos_trim.csv

Executive Summary

This report analyzes 500 network flows submitted for review. Of these, 351 flows (70.2%) were classified as potential threats by Aegis AI's machine learning ensemble.

Overall Risk Assessment: **CRITICAL**

Detailed Findings

Category	Count	% of Total
DDoS	350	70.0%
BENIGN	149	29.8%
Bot	1	0.2%

Recommendations

Based on the findings above, we recommend the following actions:

1. Immediate review of flagged flows with highest confidence scores.
2. Block or rate-limit source IPs associated with confirmed threats.
3. Establish continuous monitoring to catch similar patterns in real time.
4. Schedule a follow-up audit in 30 days to verify remediation effectiveness.

Methodology & Scope

This audit uses Aegis AI, a stacking ensemble (Random Forest, XGBoost, LightGBM) trained on millions of network flows. The system analyzes network flow metadata to classify traffic into 13 categories including DDoS, port scanning, brute-force attempts, and web application attacks. Scope: this analysis covers network-layer traffic patterns only. It does not include endpoint security, application code review, or physical security assessment. Results reflect a point-in-time analysis of the submitted data.
